### Reading Comprehension Passages

More than half of blood is plasma. This is a clear, yellow liquid, which carries all the blood cells and platelets and chemicals such as hormones and glucose. Red blood cells carry oxygen around the body, and collect carbon dioxide and take it back to the lungs where it can be sent out. There are millions of red blood cells in one small drop of blood. These cells are red because they have a red-colored chemical called hemoglobin. Red blood cells live for about 4 months, then they are broken up and used to make new blood cells. White blood cells defend the body against microbes. There are normally around 5,000 to 7,000 white cells in a milliliter of blood, but the number of white cells goes up a lot when you get sick. The white blood cells work with special proteins called antibodies.

### Choose the best answer

بهترین گزینه را انتخاب کنید .

31. Red blood cells get their color from (antibodies / hemoglobin).
32. Platelets, glucose, and blood cells can be found in (plasma /lung).
33. Antibodies are special proteins work with (red / white) blood cells.
34. When we get sick, .....
- a. the body builds more blood cells
  - b. the number of white blood cells increases
  - c. hormones and glucose defend us against microbes
  - d. red blood cells are broken and used to make new cells
